Can You Keep a Secret?

A Brief Introduction to Cryptography

William Turner

Department of Mathematics & Computer Science
Wabash College
Crawfordsville, IN 47933

Tuesday 19 September 2023

Wabash.

Outline

1. Cryptography
2. Symmetric Cryptography
   - Transposition Ciphers
   - Substitution Ciphers
3. Asymmetric Cryptography
   - Diffie-Hellman Key Exchange
   - RSA Encryption
   - Elliptic Curve Cryptography
4. Internet Communication

Cryptography

Definition

Practice of the enciphering and deciphering of messages in secret code in order to render them unintelligible to all but the intended receiver.

Cryptography

Definition

Practice of the enciphering and deciphering of messages in secret code in order to render them unintelligible to all but the intended receiver.

- *Hidden* communication
- Plaintext $\longleftrightarrow$ ciphertext
- Encrypt and decrypt / encipher and decipher

Cryptography

Definition

Practice of the enciphering and deciphering of messages in secret code in order to render them unintelligible to all but the intended receiver.

- *Hidden* communication
- Plaintext $\longleftrightarrow$ ciphertext
- Encrypt and decrypt / encipher and decipher

Etymology

- κρυπτός (hidden, secret) from κρύπτω (hide, cover)
- γράφω (write, draw)

... vs. Coding Theory

Definition

Efficient and reliable communication in an uncooperative (possibly hostile) environment.

... vs. Coding Theory

Definition

Efficient and reliable communication in an uncooperative (possibly hostile) environment.

- Encode and decode
- *Clear* communication

... vs. Coding Theory

Definition

Efficient and reliable communication in an uncooperative (possibly hostile) environment.

- Encode and decode
- *Clear* communication

Examples

- ASCII, Unicode
- Morse Code
- Universal Product Code (UPC)

Code vs Cipher

Warning!

Cryptography also has codes.

Code vs Cipher

Warning!

Cryptography also has codes.

Code

A method to encrypt a message that operates at the level of semantics or meaning (e.g., words and phrases)

Code vs Cipher

Warning!

Cryptography also has codes.

Code

A method to encrypt a message that operates at the level of semantics or meaning (e.g., words and phrases)

Cipher

A method to encrypt a message that operates at the level of syntax or symbols (e.g., letters)

Code vs Cipher

Warning!

Cryptography also has codes.

Code

A method to encrypt a message that operates at the level of semantics or meaning (e.g., words and phrases)

Cipher

A method to encrypt a message that operates at the level of syntax or symbols (e.g., letters)

- Codes were more common before the invention of the telegraph.

Symmetric-Key Algorithms

Definition

Cryptographic algorithms that use the same keys for both encryption and decryption.

Symmetric-Key Algorithms

Definition

Cryptographic algorithms that use the same keys for both encryption and decryption.

- Key is a shared secret.

Symmetric-Key Algorithms

Definition

Cryptographic algorithms that use the same keys for both encryption and decryption.

- Key is a shared secret.
- Alice sends a message to Bob encrypted by a key only she and Bob knows.

Symmetric-Key Algorithms

Definition

Cryptographic algorithms that use the same keys for both encryption and decryption.

- Key is a shared secret.
- Alice sends a message to Bob encrypted by a key only she and Bob knows.
- If Eve knows the key, she can decrypt the message.

Transposition Ciphers

Definition

Units of plaintext are rearranged to form the ciphertext.

Transposition Ciphers

Definition

Units of plaintext are rearranged to form the ciphertext.

Encrypt: Bijection acts on characters' positions

Decrypt: Apply the inverse function to the positions

Rail Fence Cipher

- Write plaintext on successive rails of an imaginary fence.
- Read ciphertext from along each rail.

Rail Fence Cipher

- Write plaintext on successive rails of an imaginary fence.
- Read ciphertext from along each rail.

Example

- Encrypt “WABASH ALWAYS FIGHTS” on a three-rail fence.

Rail Fence Cipher

- Write plaintext on successive rails of an imaginary fence.
- Read ciphertext from along each rail.

Example

- Encrypt “WABASH ALWAYS FIGHTS” on a three-rail fence.
-
```
W . . . S . . . W . . . F . . . T .
. A . A . H . L . A . S . I . H . S
. . B . . . A . . . Y . . . G . . .
```

Rail Fence Cipher

- Write plaintext on successive rails of an imaginary fence.
- Read ciphertext from along each rail.

Example

- Encrypt "WABASH ALWAYS FIGHTS" on a three-rail fence.
- ```
  W . . . S . . . W . . . F . . . T .
  . A . A . H . L . A . S . I . H . S
  . . B . . . A . . . Y . . . G . . .
  ```
- Cipher text is "WSWFTAAHLASIHSBAYG".
  ```

Columnar Transposition

- Plaintext is written on successive rows of fixed length.
- Rearrange columns using keyword.
- Ciphertext is read from columns.

Columnar Transposition

- Plaintext is written on successive rows of fixed length.
- Rearrange columns using keyword.
- Ciphertext is read from columns.

Example

- Encrypt "WABASH ALWAYS FIGHTS" using keyword "ZEBRA".

Columnar Transposition

- Plaintext is written on successive rows of fixed length.
- Rearrange columns using keyword.
- Ciphertext is read from columns.

Example

- Encrypt "WABASH ALWAYS FIGHTS" using keyword "ZEBRA".
-

Z	E	B	R	A
W	A	B	A	S
H	A	L	W	A
Y	S	F	I	G
H	T	S		

Columnar Transposition

- Plaintext is written on successive rows of fixed length.
- Rearrange columns using keyword.
- Ciphertext is read from columns.

Example

- Encrypt "WABASH ALWAYS FIGHTS" using keyword "ZEBRA".
-
Z	E	B	R	A
W	A	B	A	S
H	A	L	W	A
Y	S	F	I	G
H	T	S		

- Cipher text is "SAGBLFSAASTAWIWHYH".

Substitution Ciphers

Definition

Units of plaintext are replaced with ciphertext.

Substitution Ciphers

Definition

Units of plaintext are replaced with ciphertext.

Encrypt: Bijection acts on *contents* of the units

Decrypt: Apply the inverse function to the *contents*

Substitution Ciphers

Definition

Units of plaintext are replaced with ciphertext.

Encrypt: Bijection acts on *contents* of the units

Decrypt: Apply the inverse function to the *contents*

Types

Simple Substitution Cipher: operates on single letters

Polygraphic Cipher: operates on groups of letters

Monoalphabetic Cipher: uses fixed substitution over entire message

Polyalphabetic cipher: uses different substitutions at different positions in the message

Caesar Cipher

- Supposedly used by Julius Caesar in his private correspondence.

Caesar Cipher

- Supposedly used by Julius Caesar in his private correspondence.
- Replace each letter by a letter some fixed number of positions down the alphabet

Caesar Cipher

- Supposedly used by Julius Caesar in his private correspondence.
- Replace each letter by a letter some fixed number of positions down the alphabet

Caesar Cipher

- Supposedly used by Julius Caesar in his private correspondence.
- Replace each letter by a letter some fixed number of positions down the alphabet

Example

- Encrypt "WABASH ALWAYS FIGHTS" with a Caesar right shift of 3.

Caesar Cipher

- Supposedly used by Julius Caesar in his private correspondence.
- Replace each letter by a letter some fixed number of positions down the alphabet

Example

- Encrypt "WABASH ALWAYS FIGHTS" with a Caesar right shift of 3.
- A becomes D, B becomes E, C becomes F, ..., W becomes Z, X becomes A, Y becomes B, Z becomes C

Caesar Cipher

- Supposedly used by Julius Caesar in his private correspondence.
- Replace each letter by a letter some fixed number of positions down the alphabet

Example

- Encrypt "WABASH ALWAYS FIGHTS" with a Caesar right shift of 3.
- A becomes D, B becomes E, C becomes F, ..., W becomes Z, X becomes A, Y becomes B, Z becomes C
- Cipher text is "ZDEDVKDOADBVILJKWV".

Vigenère Cipher

- Polyalphabetic

Vigenère Cipher

- Polyalphabetic
- 26 alphabets indexed by letters

Vigenère Cipher

- Polyalphabetic
- 26 alphabets indexed by letters
- Vigenére tableau

Vigenère Cipher

- Polyalphabetic
- 26 alphabets indexed by letters
- Vigenére tableau
- Keyword to determine which alphabet used

Vigenère Cipher Example

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z

Z	Z	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y

Key: G O O D R I C H G O O D R I C H G O

Plain text: W A B A S H A L W A Y S F I G H T S

Cipher text: C O P D J P C S C O M V M Q I O Z G

Enigma Machine

- Set plugboard and rotors
- Press key on keyboard
- Rotors with randomly wired contacts rotate to new position
- Read letter from the lampboard

Advanced Encryption Standard (AES)

2001: Established by NIST

2002: Approved as federal government standard

2003: Approved by NSA for top secret information

Advanced Encryption Standard (AES)

2001: Established by NIST

2002: Approved as federal government standard

2003: Approved by NSA for top secret information

Steps

- Put message in 4×4 column-major order matrix of bytes (the *state*)
- Expand expand a short key into a number of separate round keys
- AddRoundKey – Combine each byte of the state with the round key using bitwise XOR
- SubBytes – Replace each byte with another from lookup table
- ShiftRows – Shift last three rows cyclically some number of steps
- MixColumns – Combine the four bytes of each column

Symmetric Cipher Keys

- Symmetric cipher keys must be kept secret

Symmetric Cipher Keys

- Symmetric cipher keys must be kept secret
- Requires some means of secure communication to establish key

Symmetric Cipher Keys

- Symmetric cipher keys must be kept secret
- Requires some means of secure communication to establish key
- Catch-22

Asymmetric Cryptography

Definition

Cryptographic algorithm that requires two separate keys, one of which is secret (or private) and one of which is public.

Asymmetric Cryptography

Definition

Cryptographic algorithm that requires two separate keys, one of which is secret (or private) and one of which is public.

- Public key cryptography

Asymmetric Cryptography

Definition

Cryptographic algorithm that requires two separate keys, one of which is secret (or private) and one of which is public.

- Public key cryptography
- Alice and Bob do not need to agree on a key in advance

Asymmetric Cryptography

Definition

Cryptographic algorithm that requires two separate keys, one of which is secret (or private) and one of which is public.

- Public key cryptography
- Alice and Bob do not need to agree on a key in advance
- Eve can know the public key, but still cannot decrypt the message without the private key

Asymmetric Cryptography

Definition

Cryptographic algorithm that requires two separate keys, one of which is secret (or private) and one of which is public.

- Public key cryptography
- Alice and Bob do not need to agree on a key in advance
- Eve can know the public key, but still cannot decrypt the message without the private key
- Security based on operations easy to perform, but hard to invert.

Asymmetric Cryptography

Definition

Cryptographic algorithm that requires two separate keys, one of which is secret (or private) and one of which is public.

- Public key cryptography
- Alice and Bob do not need to agree on a key in advance
- Eve can know the public key, but still cannot decrypt the message without the private key
- Security based on operations easy to perform, but hard to invert.
- One-way functions described in 1874 by William Jevons.

Diffie-Hellman Key Exchange

- Published in 1976 by Whitfield Diffie and Martin Hellman.

Diffie-Hellman Key Exchange

- Published in 1976 by Whitfield Diffie and Martin Hellman.
- Independently used by British GCHQ in 1973.

Diffie-Hellman Key Exchange

- Published in 1976 by Whitfield Diffie and Martin Hellman.
- Independently used by British GCHQ in 1973.
- Method of establishing a shared secret (e.g., for symmetric cipher)

Diffie-Hellman Key Exchange

- Published in 1976 by Whitfield Diffie and Martin Hellman.
- Independently used by British GCHQ in 1973.
- Method of establishing a shared secret (e.g., for symmetric cipher)
- Discrete logarithm problem

Diffie-Hellman Key Exchange

- Published in 1976 by Whitfield Diffie and Martin Hellman.
- Independently used by British GCHQ in 1973.
- Method of establishing a shared secret (e.g., for symmetric cipher)
- Discrete logarithm problem
  - Consider $y = g^x \bmod p$.

Diffie-Hellman Key Exchange

- Published in 1976 by Whitfield Diffie and Martin Hellman.
- Independently used by British GCHQ in 1973.
- Method of establishing a shared secret (e.g., for symmetric cipher)
- Discrete logarithm problem
  - Consider $y = g^x \bmod p$.
  - Relatively easy to compute y given x.

Diffie-Hellman Key Exchange

- Published in 1976 by Whitfield Diffie and Martin Hellman.
- Independently used by British GCHQ in 1973.
- Method of establishing a shared secret (e.g., for symmetric cipher)
- Discrete logarithm problem
  - Consider $y = g^x \bmod p$.
  - Relatively easy to compute y given x.
  - Difficult to compute x given y.

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.
4. Alice and Bob can share secret $s = g^{ab} \bmod p$.

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.
4. Alice and Bob can share secret $s = g^{ab} \bmod p$.
    - Alice computes $s = B^a \bmod p$.

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.
4. Alice and Bob can share secret $s = g^{ab} \bmod p$.
   - Alice computes $s = B^a \bmod p$.
   - Bob computes $s = A^b \bmod p$.

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.
4. Alice and Bob can share secret $s = g^{ab} \bmod p$.
   - Alice computes $s = B^a \bmod p$.
   - Bob computes $s = A^b \bmod p$.
5. Eve can know p, g, A, B, but not s.

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.
4. Alice and Bob can share secret $s = g^{ab} \bmod p$.
   - Alice computes $s = B^a \bmod p$.
   - Bob computes $s = A^b \bmod p$.
5. Eve can know p, g, A, B, but not s.

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.
4. Alice and Bob can share secret $s = g^{ab} \bmod p$.
   - Alice computes $s = B^a \bmod p$.
   - Bob computes $s = A^b \bmod p$.
5. Eve can know p, g, A, B, but not s.

Example

- $p = 101$, $g = 7$.

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.
4. Alice and Bob can share secret $s = g^{ab} \bmod p$.
   - Alice computes $s = B^a \bmod p$.
   - Bob computes $s = A^b \bmod p$.
5. Eve can know p, g, A, B, but not s.

Example

- $p = 101$, $g = 7$.
- $a = 5$

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.
4. Alice and Bob can share secret $s = g^{ab} \bmod p$.
   - Alice computes $s = B^a \bmod p$.
   - Bob computes $s = A^b \bmod p$.
5. Eve can know p, g, A, B, but not s.

Example

- $p = 101$, $g = 7$.
- $a = 5 \implies A = 7^5 \bmod 101 = 41$

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.
4. Alice and Bob can share secret $s = g^{ab} \bmod p$.
   - Alice computes $s = B^a \bmod p$.
   - Bob computes $s = A^b \bmod p$.
5. Eve can know p, g, A, B, but not s.

Example

- $p = 101$, $g = 7$.
- $a = 5 \implies A = 7^5 \bmod 101 = 41$
- $b = 11$

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.
4. Alice and Bob can share secret $s = g^{ab} \bmod p$.
   - Alice computes $s = B^a \bmod p$.
   - Bob computes $s = A^b \bmod p$.
5. Eve can know p, g, A, B, but not s.

Example

- $p = 101$, $g = 7$.
- $a = 5 \implies A = 7^5 \bmod 101 = 41$
- $b = 11 \implies B = 7^{11} \bmod 101 = 51$

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.
4. Alice and Bob can share secret $s = g^{ab} \bmod p$.
   - Alice computes $s = B^a \bmod p$.
   - Bob computes $s = A^b \bmod p$.
5. Eve can know p, g, A, B, but not s.

Example

- $p = 101$, $g = 7$.
- $a = 5 \implies A = 7^5 \bmod 101 = 41$
- $b = 11 \implies B = 7^{11} \bmod 101 = 51$
- $51^5 \bmod 101 = 60$

Diffie-Hellman Key Exchange

1. Alice and Bob agree on prime p and base g. (Both are public.)
2. Alice chooses a secret integer a and sends Bob $A = g^a \bmod p$.
3. Bob chooses a secret integer b and sends Alice $B = g^b \bmod p$.
4. Alice and Bob can share secret $s = g^{ab} \bmod p$.
   - Alice computes $s = B^a \bmod p$.
   - Bob computes $s = A^b \bmod p$.
5. Eve can know p, g, A, B, but not s.

Example

- $p = 101$, $g = 7$.
- $a = 5 \implies A = 7^5 \bmod 101 = 41$
- $b = 11 \implies B = 7^{11} \bmod 101 = 51$
- $51^5 \bmod 101 = 60$ and $41^{11} \bmod 101 = 60$.

7. Bob decrypts the ciphertext C as $M = C^d \bmod m$.

RSA Encryption

Example

- $p = 101, q = 103$

RSA Encryption

Example

- $p = 101, q = 103 \implies m = 10403, \varphi(m) = 10200.$

RSA Encryption

Example

- $p = 101, q = 103 \implies m = 10403, \varphi(m) = 10200.$
- $e = 2243$

RSA Encryption

Example

- $p = 101, q = 103 \implies m = 10403, \varphi(m) = 10200.$
- $e = 2243 \implies d = 5507.$

RSA Encryption

Example

- $p = 101, q = 103 \implies m = 10403, \varphi(m) = 10200.$
- $e = 2243 \implies d = 5507.$
- Convert "WABASH ALWAYS FIGHTS" to ASCII:

RSA Encryption

Example

- $p = 101, q = 103 \implies m = 10403, \varphi(m) = 10200.$
- $e = 2243 \implies d = 5507.$
- Convert "WABASH ALWAYS FIGHTS" to ASCII:
  $$M = \begin{aligned}[t] &[87, 65, 66, 65, 83, 72, 32, 65, 76, 87,\\ &\ 65, 89, 83, 32, 70, 73, 71, 72, 84, 83]\end{aligned}$$

RSA Encryption

Example

- $p = 101, q = 103 \implies m = 10403, \varphi(m) = 10200.$
- $e = 2243 \implies d = 5507.$
- Convert "WABASH ALWAYS FIGHTS" to ASCII:
  $$M = [87, 65, 66, 65, 83, 72, 32, 65, 76, 87, 65, 89, 83, 32, 70, 73, 71, 72, 84, 83]$$
- Encrypt:
  $$C = [2620, 1835, 5420, 1835, 6113, 2874, 544, 1835, 8507, 2620, 1835, 7335, 6113, 544, 1726, 848, 9447, 2874, 1198, 6113]$$

RSA Encryption

Example

- $p = 101, q = 103 \implies m = 10403, \varphi(m) = 10200.$
- $e = 2243 \implies d = 5507.$
- Convert "WABASH ALWAYS FIGHTS" to ASCII:
  $$M = \begin{array}{l}[87, 65, 66, 65, 83, 72, 32, 65, 76, 87, \\ \ 65, 89, 83, 32, 70, 73, 71, 72, 84, 83]\end{array}$$
- Encrypt:
  $$C = \begin{array}{l}[2620, 1835, 5420, 1835, 6113, 2874, 544, \\ \ 1835, 8507, 2620, 1835, 7335, 6113, 544, \\ \ 1726, 848, 9447, 2874, 1198, 6113]\end{array}$$
- Decrypt:
  $$M = \begin{array}{l}[87, 65, 66, 65, 83, 72, 32, 65, 76, 87, \\ \ 65, 89, 83, 32, 70, 73, 71, 72, 84, 83]\end{array}$$

Elliptic Curves

$$y^2 = x^3 + ax + b$$

Elliptic Curves

$$y^2 = x^3 + ax + b$$

$$P + P + 0 = 0$$
$$2P = P + P = 0$$

Elliptic Curve Diffie-Hellman

- Alice and Bob agree on public parameters:
  - Define elliptic curve p, a, b: $y^2 \equiv x^3 + ax + b \pmod{p}$
  - Point on curve G
- Alice picks private integer d_A with $0 \leq d_a < p$.
  - Alice sends Bob $Q_A = d_A G$.
- Similarly, Bob picks d_B and sends Alice $Q_B = d_B G$.
- Alice and Bob compute $(x_k, y_k) = d_A Q_B = d_B Q_A$.
  - Shared secret is x_k.

Transport Layer Security (TLS)

Symmetric Cryptography

- Relatively fast
- Requires shared secret

Asymmetric Cryptography

- Does not require shared secret
- Can authenticate digital signatures
- Typically requires larger keys for same security
- Relatively slow

Transport Layer Security (TLS)
